

Advanced Colour Matching

Nanofibres are available in 10 natural looking shades which can be combined to make the perfect colour for anyone.

You can even mix dark and light colours (e.g. Dark Brown and Grey) to give the 'salt and pepper' look.

Nanogen Development

We are constantly developing and improving Nanofibres to offer unrivalled performance in a range of environmental conditions. Many technical innovations separate us from products of the 1990's including:

Protein-moulding: We have changed the raw keratin microfibre into the optimum shape & dimensions for blending with the existing hair.

Active dispensing: Specially made materials, including the jar polymer, electrostatic strip (patent process*) & charge donating sifter means Nanofibres carry the optimum charge for binding to the hair.

Cross-continental colour matching: There are subtle differences between Asia, Europe & America's 'dark brown' hair colour. Nanofibres are compatible with all ethnic hair colour shades.

Electrostatic keratin-coating: A special nano-sized film covering each and every fibre to store charge, maintains translucent colour properties, reduce weight/bulk ratio and prevent itchiness.

These are just some of the reasons why Nanofibres are Europe's No.1 selling instant hair microfibre, tested by our trusted consumer and hair loss expert panel.

You would say that, wouldn't you?

These days, we're so bombarded with marketing messages it's difficult for the consumer to tell fact from fiction.

We understand that despite being the undisputed European brand leader and having testimonials from countless end users, including celebrities, the most significant endorsement we can present to you is that of the leaders and experts of the world hair loss community.

From hair loss doctors to transplant surgeons. From information charities to website forums. Only Nanogen has their explicit permission to use their logo demonstrating their ringing endorsement.

So yes, we would say that, but give us a try either buying direct, or from one of our authorised distributors and you'll be saying it too. Don't forget, any purchase from Nanogen benefits from an unconditional 30 day money back guarantee.

Suitable for Men & Women

Nanogen is designed to work equally as effectively on both sexes, and for people of any age. Whether you're a gentleman who accepts gradual loss over the years but would like to cosmetically control the rate and scale of their thinning appearance or if you are a lady that has a thinning problem which tends not to get much worse than patchy loss or generalized thinning - Nanogen is perfect for you.

Take control over your hair loss and don't look back!

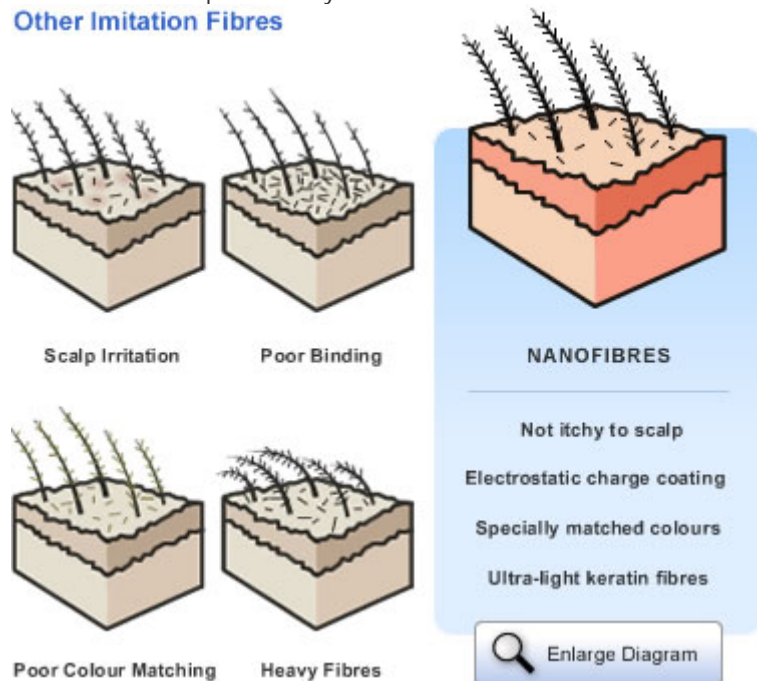

Electrostatically Charged

The Nanofibres jar is specially designed to give maximum static charge to the microfibrils. Fibres become more charged as they exit the dispensing mesh. The materials in the Nanogen dispensing system have been chosen based on their electrostatic donating potential.

Discreet Packaging

At Nanogen, we respect your privacy. Only outer cartons and package inserts describe the nature of each Nanogen product. Keep Nanogen products anywhere with confidence.

Other Imitation Fibres

How do Nanofibres work?

Nanogen is applied quickly and without mess by simply shaking the container over the thinning area, releasing thousands of the microscopic colour-matched hair microfibrils, which intertwine with, and branch off of the real hairs.

Charged with static electricity, they bond in fir tree patterns along the hair fibre so securely that they will stay in place all day, in strong winds and rain, and will not stain or smear, but can be easily washed out with a shampoo wash.

The fir tree pattern creates a realistic looking AND feeling density. Other sprays and creams simply colour the scalp to make the hair loss less visible. Nanogen is completely different.

As the Nanofibres actually cling to individual hairs, the effect feels natural and allows styling like you never again thought possible. Every time you look in the mirror you will be truly amazed.
